Найбільш поширені команди Artisan:
php artisan list: Відображає список усіх доступних команд Artisan.
php artisan make:model <ModelName>: Створює новий клас моделі Eloquent.
php artisan make:controller <ControllerName>: Створює новий клас контролера.
php artisan make:migration <MigrationName>: Створює новий файл міграції для роботи з базою даних.
php artisan migrate: Запускає всі міграції бази даних.
php artisan migrate:rollback: Відкочує останні міграції.
php artisan Tinker: Відкриває інтерактивну консоль РНР (REPL) для тестування та роботи з кодом у
вашому застосунку.
php artisan inspire: Виводить надихаючу цитату.
Команли лля створення компонентів:
php artisan make:channel: Створює новий клас каналу.
php artisan make:command: Створює нову кастомну команду Artisan.
php artisan make:event: Створює нову подію.
php artisan make:exception: Створює нове користувацьке виключення.
php artisan make:factory: Створює фабрику моделі для генерації тестових даних.
php artisan make:job: Створює новий клас завдання (job).
php artisan make:listener: Створює новий слухач події.
php artisan make:mail: Створює новий клас для надсилання електронних листів.
php artisan make:middleware: Створює новий middleware.
php artisan make:notification: Створює нове повідомлення.
php artisan make:observer: Створює новий спостерігач (observer).
php artisan make:policy: Створює нову політику.
php artisan make:provider: Створює новий сервіс-провайдер.
```

```
php artisan make:request: Створює новий клас запиту.
php artisan make:resource: Створює новий ресурс.
php artisan make:rule: Створює нове правило валідації.
php artisan make:seeder: Створює новий сидер для заповнення бази даних.
php artisan make:test: Створює новий тест.

       Application Name
       This value is the name of your application, which will be used when the
       framework needs to place the application's name in a notification or
       other UI elements where an application name needs to be displayed.
     'name' => env('APP NAME', 'Laravel'),
       Application Environment
       This value determines the "environment" your application is currently
       running in. This may determine how you prefer to configure various services the application utilizes. Set this in your ".env" file.
     'env' => env('APP ENV', 'production'),
       Application Debug Mode
       When your application is in debug mode, detailed error messages with
       stack traces will be shown on every error that occurs within your application. If disabled, a simple generic error page is shown.
     'debug' => (bool) env('APP DEBUG', false),
       Application URL
       This URL is used by the console to properly generate URLs when using
       the Artisan command line tool. You should set this to the root of the application so that it's available within Artisan commands.
     'url' => env('APP URL', 'http://localhost'),
       Application Timezone
       Here you may specify the default timezone for your application, which will be used by the PHP date and date-time functions. The timezone is set to "UTC" by default as it is suitable for most use cases.
     'timezone' => 'UTC',
       Application Locale Configuration
```

```
The application locale determines the default locale that will be used
       by Laravel's translation / localization methods. This option can be
       set to any locale for which you plan to have translation strings.
       'locale' => env('APP LOCALE', 'en'),
//
//
//
       'fallback locale' => env('APP FALLBACK LOCALE', 'en'),
       'faker_locale' => env('APP_FAKER_LOCALE', 'en_US'),
     'locale' => 'uk',
'fallback_locale' => 'uk',
     'faker_locale' => 'uk_UA',
      ______
       Encryption Key
      This key is utilized by Laravel's encryption services and should be set
      to a random, 32 character string to ensure that all encrypted values are secure. You should do this prior to deploying the application.
     'cipher' => 'AES-256-CBC',
     'key' => env('APP KEY'),
     'previous_keys' => [
         ...array filter(
              explode(',', env('APP PREVIOUS KEYS', ''))
         ),
     ],
      Maintenance Mode Driver
       These configuration options determine the driver used to determine and
      manage Laravel's "maintenance mode" status. The "cache" driver will allow maintenance mode to be controlled across multiple machines.
       Supported drivers: "file", "cache"
     'maintenance' => [
  'driver' => env('APP_MAINTENANCE_DRIVER', 'file'),
  'store' => env('APP_MAINTENANCE_STORE', 'database'),
     ],
];
```

```
<?php
return [
      Authentication Defaults
      This option defines the default authentication "guard" and password
      reset "broker" for your application. You may change these values
      as required, but they're a perfect start for most applications.
    'defaults' => [
    'guard' => env('AUTH_GUARD', 'web'),
    'passwords' => env('AUTH_PASSWORD_BROKER', 'users'),
    ],
      Authentication Guards
      Next, you may define every authentication guard for your application. Of course, a great default configuration has been defined for you
      which utilizes session storage plus the Eloquent user provider.
      All authentication guards have a user provider, which defines how the
      users are actually retrieved out of your database or other storage
      system used by the application. Typically, Eloquent is utilized.
      Supported: "session"
    'guards' => [
'web' => [
             'driver' => 'session',
              'provider' => 'users',
         ],
    ],
      User Providers
      All authentication guards have a user provider, which defines how the
      users are actually retrieved out of your database or other storage
      system used by the application. Typically, Eloquent is utilized.
      If you have multiple user tables or models you may configure multiple
      providers to represent the model / table. These providers may then
      be assigned to any extra authentication guards you have defined.
      Supported: "database", "eloquent"
    'providers' => [
    'users' => [
    'driver' => 'eloquent',
              'model' => env('AUTH_MODEL', App\Models\User::class),
         ],
         // 'users' => [
// 'driver' => 'database',
                 'table' => 'users',
         //
         // 1,
    ],
```

```
Resetting Passwords
  These configuration options specify the behavior of Laravel's password reset functionality, including the table utilized for token storage and the user provider that is invoked to actually retrieve users.
  The expiry time is the number of minutes that each reset token will be considered valid. This security feature keeps tokens short-lived so
  they have less time to be guessed. You may change this as needed.
  The throttle setting is the number of seconds a user must wait before
  generating more password reset tokens. This prevents the user from quickly generating a very large amount of password reset tokens.
'passwords' => [
    'users' => [
           'provider' => 'users'
           'table' => env('AUTH_PASSWORD_RESET_TOKEN_TABLE', 'password_reset_tokens'),
'expire' => 60,
           'throttle' => 60,
     ],
],
  Password Confirmation Timeout
  Here you may define the amount of seconds before a password confirmation
  window expires and users are asked to re-enter their password via the
  confirmation screen. By default, the timeout lasts for three hours.
'password timeout' => env('AUTH PASSWORD TIMEOUT', 10800),
```

```
<?php

     public_path('storage') => storage_path('app/public'),
],
];
```

```
<?php
use Illuminate\Support\Str;
return [
     Horizon Domain
      This is the subdomain where Horizon will be accessible from. If this
      setting is null, Horizon will reside under the same domain as the
      application. Otherwise, this value will serve as the subdomain.
    'domain' => env('HORIZON DOMAIN'),
     Horizon Path
     This is the URI path where Horizon will be accessible from. Feel free
     to change this path to anything you like. Note that the URI will not affect the paths of its internal API that aren't exposed to users.
    'path' => env('HORIZON PATH', 'horizon'),
      Horizon Redis Connection
     This is the name of the Redis connection where Horizon will store the
     meta information required for it to function. It includes the list
      of supervisors, failed jobs, job metrics, and other information.
    'use' => 'default',
     Horizon Redis Prefix
     This prefix will be used when storing all Horizon data in Redis. You
     may modify the prefix when you are running multiple installations
      of Horizon on the same server so that they don't have problems.
    'prefix' => env(
        'HORIZON PREFIX'
        Str::slug(env('APP NAME', 'laravel'), ' ').' horizon:'
    ),
     Horizon Route Middleware
      These middleware will get attached onto each Horizon route, giving you
      the chance to add your own middleware to this list or change any of
      the existing middleware. Or, you can simply stick with this list.
    'middleware' => ['web'],
```

```
Queue Wait Time Thresholds
   This option allows you to configure when the LongWaitDetected event
  will be fired. Every connection / queue combination may have its own, unique threshold (in seconds) before this event is fired.
'waits' => [
        'redis:default' => 60,
   Job Trimming Times
  Here you can configure for how long (in minutes) you desire Horizon to persist the recent and failed jobs. Typically, recent jobs are kept for one hour while all failed jobs are stored for an entire week.
'trim' => [
      Lm' => [
'recent' => 60,
'pending' => 60,
'completed' => 60,
'recent_failed' => 10080,
'failed' => 10080,
'monitored' => 10080,
],
   Silenced Jobs
  Silencing a job will instruct Horizon to not place the job in the list of completed jobs within the Horizon dashboard. This setting may be
   used to fully remove any noisy jobs from the completed jobs list.
'silenced' => [
       // App\Jobs\ExampleJob::class,
  Metrics
  Here you can configure how many snapshots should be kept to display in the metrics graph. This will get used in combination with Horizon's `horizon:snapshot` schedule to define how long to retain metrics.
'metrics' => [
       'trim_snapshots' => [
    'job' => 24,
    'queue' => 24,
       ],
],
  Fast Termination
```

```
When this option is enabled, Horizon's "terminate" command will not wait on all of the workers to terminate unless the --wait option
   is provided. Fast termination can shorten deployment delay by
   allowing a new instance of Horizon to start while the last
   instance will continue to terminate each of its workers.
'fast termination' => false,
   Memory Limit (MB)
   This value describes the maximum amount of memory the Horizon master supervisor may consume before it is terminated and restarted. For
   configuring these limits on your workers, see the next section.
'memory_limit' => 64,
   Queue Worker Configuration
   Here you may define the queue worker settings used by your application in all environments. These supervisors and settings handle all your queued jobs and will be provisioned by Horizon during deployment.

     ],
];
```

```
<?php
use Illuminate\Support\Str;
return [
     Default Session Driver
     This option determines the default session driver that is utilized for
     incoming requests. Laravel supports a variety of storage options to
     persist session data. Database storage is a great default choice.
     Supported: "file", "cookie", "database", "apc",
                 "memcached", "redis", "dynamodb", "array"
    'driver' => env('SESSION DRIVER', 'database'),
     ______
     Session Lifetime
     Here you may specify the number of minutes that you wish the session
     to be allowed to remain idle before it expires. If you want them
     to expire immediately when the browser is closed then you may
     indicate that via the expire_on_close configuration option.
    'lifetime' => (int) env('SESSION LIFETIME', 120),
    'expire on close' => env('SESSION EXPIRE ON CLOSE', false),
     Session Encryption
     This option allows you to easily specify that all of your session data
     should be encrypted before it's stored. All encryption is performed
     automatically by Laravel and you may use the session like normal.
    'encrypt' => env('SESSION ENCRYPT', false),
     Session File Location
     When utilizing the "file" session driver, the session files are placed on disk. The default storage location is defined here; however, you
     are free to provide another location where they should be stored.
    'files' => storage path('framework/sessions'),
     Session Database Connection
     When using the "database" or "redis" session drivers, you may specify a
     connection that should be used to manage these sessions. This should
     correspond to a connection in your database configuration options.
```

```
*/
'connection' => env('SESSION CONNECTION'),
 ______
 Session Database Table
 When using the "database" session driver, you may specify the table to
 be used to store sessions. Of course, a sensible default is defined
 for you; however, you're welcome to change this to another table.
'table' => env('SESSION TABLE', 'sessions'),
 ______
 Session Cache Store
 When using one of the framework's cache driven session backends, you may
 define the cache store which should be used to store the session data
 between requests. This must match one of your defined cache stores.
 Affects: "apc", "dynamodb", "memcached", "redis"
'store' => env('SESSION STORE'),
 ______
 Session Sweeping Lottery
 Some session drivers must manually sweep their storage location to get
 rid of old sessions from storage. Here are the chances that it will
 happen on a given request. By default, the odds are 2 out of 100.
'lottery' => [2, 100],
 Session Cookie Name
 Here you may change the name of the session cookie that is created by
 the framework. Typically, you should not need to change this value
 since doing so does not grant a meaningful security improvement.
'cookie' => env(
    'SESSION COOKIE'
   Str::slug(env('APP NAME', 'laravel'), ' ').' session'
),
 Session Cookie Path
 The session cookie path determines the path for which the cookie will
 be regarded as available. Typically, this will be the root path of your application, but you're free to change this when necessary.
'path' => env('SESSION PATH', '/'),
```

```
Session Cookie Domain
      This value determines the domain and subdomains the session cookie is
      available to. By default, the cookie will be available to the root
      domain and all subdomains. Typically, this shouldn't be changed.
    'domain' => env('SESSION DOMAIN'),
     HTTPS Only Cookies
      By setting this option to true, session cookies will only be sent back
     to the server if the browser has a HTTPS connection. This will keep
      the cookie from being sent to you when it can't be done securely.
    'secure' => env('SESSION SECURE COOKIE'),
     HTTP Access Only
     Setting this value to true will prevent JavaScript from accessing the
      value of the cookie and the cookie will only be accessible through
      the HTTP protocol. It's unlikely you should disable this option.
    'http only' => env('SESSION HTTP ONLY', true),
      Same-Site Cookies
     This option determines how your cookies behave when cross-site requests
      take place, and can be used to mitigate CSRF attacks. By default, we
      will set this value to "lax" to permit secure cross-site requests.
     See: https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/Set-Cookie#samesitesamesite-
value
      Supported: "lax", "strict", "none", null
    'same site' => env('SESSION SAME SITE', 'lax'),
     Partitioned Cookies
     Setting this value to true will tie the cookie to the top-level site for
     a cross-site context. Partitioned cookies are accepted by the browser when flagged "secure" and the Same-Site attribute is set to "none".
    'partitioned' => env('SESSION_PARTITIONED_COOKIE', false),
